                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                           This sequence represents complementarity determinating region 3 (CDR L3) of the light chain of murine anti-CD23 (FCERII) monoclonal antibody C11 (see also AAY3262). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of C11 light and heavy chain CDRs (see AAY3224-59) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupue reythematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveltis, dermatifis, psoriasis, unitiple sclerosis, diabetes, uveltis, dermatifis, psoriasis, unitiple sclerosis, csyndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, 5jogren's syndrome, allergies, allergic schma, intrinsic asthma, acute asthmatic execerbation, rhinitis, eczema, graft-versus-host disease, COPD, insulitis, bronchitis (particularly type I (particularly thronic bronchitis) or diabetes (particularly type I (or studying interactions between CD23 and various ligands and cermining the binding agents.
                                                                     Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CD23; FCERII; IgE receptor; monoclonal antibody; CII; mouse; human; monoclonal antibody; chimeric antibody; humanised antibody; complementearity determining region; CDR; autoimmune disease; inflammation; arthritis; lupus erythematosus; multiple sclerosis; Hashimoto's thyroiditis; diabetes; uveitis; dermatitis; psoriasis; urticaria; nephrotic syndrome; glomerulonephritis; urticaria; nephrotic syndrome; glomerulonephritis; crohn's disease; Sjogren's syndrome; allergy; asthma; rhinitis; eczema; insulitis; grafţ-versus-host disease; COPD; bronchitis; diabetes;

this sequence represents the light chain variable region (VL) of humanised anti-CD23 (PCERII) monoclonal antibody C11 composed of a human framework (HSTGRVII) and the light chain composed of a human framework (HSTGRVII) and the light chain complementarity determining regions (see AAY212254-56) of murine antibody C11. The DNA was constructed by splice overlap PCR. The invention provides altered antibodies, auch as chimeric or humanised antibodies, which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on human therapy, for the treatment of arthritis, and heavtpoictic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's fibyroiditis, multiple sclerosis, clabetes, uveitis, dermatitis, inflammatory bowel disease, ulcerative colitis, crohn's disease, Sjogren's syndrome, allergiaes, allergic sthma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, eczema, graft-versus-host disease, COPD, insulitis, bronchitis (particularly thronic bronchitis) or diabetes (particularly type I colitis, dath, and B-cell malignancies (claimed). They are also useful for studying interactions between CD23 and various ligands and certermining the binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                 Region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT 3
```

```
This sequence represents the light chain variable region (VL) of murine anti-CD23 (FCERII) monoclonal antibody C11. The invention provides altered antibodies, such as chimeric or humanised antibodies (see AAY32262), which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions (see AAY32264-59) to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble, CD33 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimoto's thyroiditis, multiple sclerosis, diabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogren's syndrome, allergies allergic sthma, intrinsic asthma, as syndrome, allergies, allergic sthma, intrinsic asthma, as syndrome, inclusing schma, and eccema, graft-versus-host disease, COPD, insultis, bronchitis, cromying the Area of the season of diabetes), and B-cell malignancies (claimed). They are also useful disease, bind and various ligands and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cell receptor specific antibodies useful for treating e.g. arthritis
inflammation, arthritis; lupus erythematosus; multiple sclerosis; Hashimoto's thyroiditis; diabetes; uveitis; bernatitis; psoriasis; urticaria; nephrotic syndrome; glomerulomephritis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; inflammatory bowel disease; asthma; rhinitis; czemm; allergy; asthma; rhinitis; czemm; insulitis; graft-versus-host disease; COPD; bronchitis; diabetes; B-cell malignancy; therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                erythematosus (SLE) by down-regulating the autoimmune response to the Cterminal DNA-binding domain of p53 protein by an active compound. The present sequence is a IDI-1 i3 peptide which comprises the complementarity determining region (CDR) of the light chain of IDI-1 monoclonal antibody (mAb). The IDI-1 mAb is an anti-idiotypic antibody Ab2 mAb specific for PAb-421 which is an Ab1 mAb specific to the C-terminal DNA-binding domain of murine p53 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The peptide corresponds to residues 92-110 of IDI-1 light chain variable region. It is an example of the active compound useful in the diagnosis, prevention and treatment of SLE in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               patent discloses a method for the treatment of systemic lupus

The mouse VL gene product may be used to produce chimeric mouse-human Abs against HIV-1 comprising human Ig constant regions and murine variable regions. These novel sequence are useful in treatment, diagnosis and prophylaxis of HIV infections, and may be produced by a bacterial, yeast or mammalian expression system.
                                                                                                                                                                                                                New chimeric mouse human antibodies - used in treatment, diagnosis and prophylaxis of HIV infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is the light (kappa)- chain variable (V) region of a mouse monoclonal antibody (MAb), 2E12, and is specific for an HIV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New chimeric mouse-human antibodies - used to detect, kill and remove HIV-1 antigen from sample

The present sequence is a light chain variable region of IDI-1 an anti-diotypic antibody/Ab2 monoclonal antibody (mAb) specific for PAb-421 which is an Ab1 mAb specific to the C-terminal DNA-binding domain of murine p53 protein. The Ab1 and Ab2 mAbs and peptides based on complementarity determining regions of light and heavy chain variable regions of these antibodies, are examples of active compounds useful in the diagnosis, prevention and treatment of SLE in humans.

AAW39821-23 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 2A10, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2A10 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2A10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;
   viral antigen. It is used in the construction of a chimeric Mab comprising heavy and light chains having murine V regions and human C regions. The chimeric Mabs are more effective than murine Mab 2B12 since they have an increased compatibility in humans. The heavy and light chain V-regions are joined by manipulating their respective joining (d) regions, to generate restriction enzyme recognition sites. The chimeric Mabs can be used as immunoconjugates, in association with e.g. toxins for HIV treatment. They can also be used in diagnosis of HIV.

A series of cocaine transition state analogues (TSAB) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).

A series of cocaine transitions state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic caid from 3H-phenyl cocaine, The 2AHO antibody (AAW39809 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 2AHO has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can

The patent discloses a humanised antibody or its antigen-binding fragment, having binding specificity for CC-chemokine receptor 2 (CCR2), comprising an antigen binding region of non-human origin and at least a portion of an immunoglobulin of human origin. The and at least a portion of an immunoglobulin of human origin. The humanised antibodies are useful for inhibiting the interaction of a cell expressing CCR2. They are useful for inhibiting or treating CCR2. They are useful for inhibiting or treating cortion of a cell expressing cCR2 autoimmune disorders such as rheumatory disorder, autoimmune disorders such as thermatory disorder, autoimmune disorders such as thermatory disorder, autoimmune disorders such as thermatory arthritis and multiple sclerosis, atherogenesis and atherosclerosis, arthritis and inthe manufacture of a medicament for treating CCR2 mediated alleratory chronic and acute inflammatory glomerulopathies, acquired mediated allerator reaction, shock, stenosis, allograft rejection, fibrotic disease, asthma, inflammatory glomerulopathies, acquired intervention, including angioplasty and/or stent placement in a mammal. CC Humanised antibodies are also useful for inhibiting narrowing of the lumanised antibodies are also useful for inhibiting narrowing of the lumanised antibodies are also useful for inhibiting nearming of a vessel in a mammal, preferably associated with vascular intervention.

The present sequence is mouse germline kappa light chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
inflammatory disorder; autoimmune disorder; rheumatoid arthritis; shock; multiple sclerosis; atherogenesis; atherosclerosis; restenosis; asthma; anaphylaxis; malignancy; inflammation; stenosis; allograft rejection; fibrotic disease; angloplasty; acquired immune deficiency syndrome; AIDS; inflammatory glomerulopathy; vascular intervention; neointimal hyperplasia; VK; kappa light chain variable region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Humanized immunoglobulin for treating a CC-chemokine receptor 2-mediated disorder in a patient, comprises a binding specificity for CCR2, and a non-human antigen binding region and human immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 3B9 antibody (AAW39806 represents the heavy chain) was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 3B9 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Variable domain of the Kappa light chain of catalytic antibody 12H1.
                                                                                                                                                                                                                                                                New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAW39815-17 represent the sequences of the light chain complementarity determining regions (CDRs) of the catalytic antibody 389, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 31+Denzoic acid from 3H-phnyl cocaine. The 389 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody 389 has a per minute Kcat of 0.11. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Variable domain; lambda light chain; catalytic antibody; degradation; cocaine; cocaine transition state analogue; TSA; benzoic acid; phenyl cocaine; immunogenic conjugate; reduction; cocaine; treatment; overdose; addiction.

AAW39801-05 represent the amino acid sequences of the variable domain of the Kappa light chain of catalytic antibodies which are able to degrade occaine. A series of cocaine pransition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release sh-benzoic acid from 3h-phenyl occaine. The 12H1 antibody (AAW39808 represents the heavy chain) was identified using TSA2, and has a per minute Kcat of 0.016. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be achieved).
                                                                                                                  New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WSX*receptor and related antibodies and ligands - used to develop products for diagnosis and therapy, e.g. for improving haematopoigsis or for treating tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ligand, activator, antibody, agonist; proliferation; obseity; differentiation; anaemia; treatment; neoplasia; arteriosclerosis; Type II diabetes; polycystic ovarian disease; cardiovascular disease; postcoarthritis; dermatological disorder; hypertension; insulin resistance; hypertholesterolaemia; hypertriglyceridaemia; cancer; cholelithiasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; WSX receptor; clone #17; identification; purification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     75.0%; Score 36; DB 19; Length 113; 66.7%; Pred. The present sequence is an agonist antibody clone to the human WSX receptor, which can be used to identify and purify ligands and activators. An anti-WSX receptor antibody can be used as an agonist to activate the WSX receptor, leading to enhanced proliferation or differentiation of a cell expressing the WSX receptor. It can also differentiation of a cell expressing the WSX receptor. It can also intake in an obese mammal. WSX receptor ligands can be used to enhance proliferation or differentiation of lymphoid, myeloid or contake in an obese mammal. WSX receptor ligands can be used to sepecially a human, is suffering from decreased blood cell levels, i.e. anaemia, caused by chemotherapy, radiation therapy or bone marrow transplantation therapy. It can also be used to repopulate marrow transplantation therapy. It can also be used to repopulate collocation disorders, arteriosclerosis, Type II diabetes, polycystic ovarian disease, cardiovascular diseases, cardiovascular diseases, cardiovascular diseases, can cholelithiasis.

"DNA sequence of the SFT1 gene from Kluyveromyces lactis.";

submitted (JUN-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: P-ACTIN CAPPING PROTEINS BIND IN A CA(2+)-INDEPENDENT

MANNER TO THE FAST GROWING ENDS OF ACTIN FILAMENTS (BARBED END)

THEREBY BLOCKING THE EXCHANGE OF SUBMINTS AT THESE ENDS. UNLIKE

OTHER CAPPING PROTEINS (SUCH AS GELSOLIN AND SEVERIN), THESE

PROTEINS DO NOT SEVER ACTIN FILAMENTS (BY SIMILARITY).

-!- SUBUNIT: HETERODIMER OF AN ALPHA AND A BETA SUBUNIT (BY
                                                                                                                                                                                                                                                                                                                                                                         Kluyveromyces lactis (Yeast).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "Carbamate kinase from Enterococcus faecalis and Enterococcus faecium. Cloning of the genes studies on the enzyme expressed in Bscherichia coli, sequences similarity with N-acetyl-L-glutamte kinase."; Submitted (FBE-1998) to the EMBL/GenBank/DDBJ databases.
                                                                                             Koeck J.L., Baemaciogullari S., Parzy D., Barnaud G., Teyssou R., Buisson Y., Philippon A., Arlet G.J.;

"Cloning and sequencing of ampC and ampR genes from Providencia stuartii.";

Submitted (MAY-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: THIS PROTEIN IS A POSITIVE REGULATOR OF GENE EXPRESSION OF BETA-LACTAMASE (AMPC).

-!- SUBCELJULAR LOCATION: Cytoplasmic (By similarity).

-!- SIMILARITY: BELONGS TO THE LYSR FAMILY OF TRANSCRIPTIONAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Enterococcus faecium (Streptococcus faecium), and
Enterococcus faecalis (Streptococcus faecalis).

AND ORNITHINE TO ALLOW HIGH-EFFICIENCY ENREGY CONVERSION IN THE AND ORNITHINE DEIMINASE PATHWAY (BY SIMILARITY).
SIBCELLULAR LOCATION: Integral membrane protein (Potential).
                                                                                      phosphate.
--- PATHWAY: Arginine degradation via arginine deiminase; third step.
---- SUBUNIT: HOMODIMER (PREDOMINANTLY) AND HOMOTETRAMER.
---- SUBCELLULAR LOCATION: Cytoplasmic (Potential).
---- SIMILARITY: BELONGS TO THE CARBAMATE KINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

-!- CATALYTIC ACTIVITY: ATP + glycine + tRNA(Gly) = AMP + diphosphate
-!- + glycyl-tRNA(Gly).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: BELONGS TO CLASS-II AMINOACYL-TRNA SYNTHETASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      J. MOI. BIOL. 224:639-657(1992).

-!- FUNCTION: THIS COLICIN IS A CHANNEL-FORMING COLICIN. THIS CLASS OF TRANSMEMBRANE TOXINS DEPOLARIZE THE CYTOPLASMIC MEMBRANE, LEADING TO DISSIPATION OF CELLULAR ENERGY.

-!- FUNCTION: COLICINS ARE POLYEPETIDE TOXINS PRODUCED BY AND ACTIVE AGAINST, ESCHERICHIA COLI AND CLOSELY RELATED BACTERIA.

-!- SIMILARITY: BELONGS TO THE CHANNEL FORMING COLICIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Morlon J., Lloubes R., Varenne S., Chartier M., Lazdunski C.; "Complete nucleotide sequence of the structural gene for colicin A, a gene translated at non-uniform rate."; J.                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                     This sequence represents complementarity determinating region 1 (CDR HI) of the heavy chain of murine anti-CD23 (FCERII) monoclonal antibody C11 (see also AAY32253). The invention provides altered antibodies, such as chimeric or humanised antibodies, which comprise utficient of the amino acid sequences of C11 light and heavy chain CDRs (see AAY32254-59) to render them_repable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation for treatment of arthritis, lupus erythematous, Hashimoto's thyroiditis, multiple sclerosis, clabetes, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulonephritis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, Sjogran's syndrome, allergies, allergic asthma, intrinsic asthma, acte asthma, acte asthma, care asthma, care asthma, disease, COPD, insulitis, bronchitis cacema, graft-versus-host disease, COPD, insulitis, bronchitis diabetes), and B-cell malignancies (claimed). They are also useful for etermining the binding agents.
                                                          Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -

This sequence represents the heavy chain variable region (VH) of murine anti-CD23 (FCERII) monoclonal antibody Cl1. The invention provides altered antibodies, such as chimeric or humanised antibodies less AAV32262 and AAV32263), which comprises sufficient of antibodies (see AAV32262), which comprises sufficient of the amino acid sequences of the Cl1 light and heavy chain complementarity determining regions (see AAV32254-59) for render them capable of binding to the CD23 type II molecule expressed on hamman therapy, for the treatment of arthritis, lammatopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematosus, Hashimto's thyroiditis, multiple sclerosis, labered verthematosus, Hashimto's thyroiditis, multiple sclerosis, clabetes, uveitis, dermatitis, psoriasis, uriticalis, actualitis, inflammatory bowel disease, ulcerative colitis, crohn's disease, sinflammatory bowel disease, ulcerative colitis, troin's disease, Signers asthmatic excension; rhinitis, contine, acute asthmatic excension; rhinitis, excension; diabetes (particularly type I (particularly chronic bronchitis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful cetermining the binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cell receptor specific antibodies useful for treating e.g. arthritis, diabetes, multiple sclerosis and psoriasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This amino acid sequence represents the heavy chain of humanised anti-CD23 (FCERII) monoclonal antibody C11, composed of a human framework (HSIGRVII) and the heavy chain complementarity determining regions (see AAV32257-59) of murine antibody C11. The DNA was constructed by splice overlap PCR. The invention provides attered antibodies, such as chimanised antibodies, which comprise sufficient of the amino acid sequences of the C11 light and heavy chain complementarity determining regions to render them capable of binding to the CD23 type II molecule expressed on haematopoietic cells. The antibodies are used to block soluble CD23 formation in human therapy, for the treatment of arthritis, lupus erythematorous, Hashimoto's thyroiditis, multiple sclerosis, clabeles, uveitis, dermatitis, psoriasis, urticaria, nephrotic syndrome, glomerulomephritis, inflammatory bowel disease, ulcerative collitis, crohn's disease, Sjogrem's syndrome, allergies, allergic athma, intrinsic asthma, acute asthmatic exacerbation, rhinitis, eczema, graft-versus-host disease, COPD, insulitis, bronchiis (particularly thronic bronchiis) or diabetes (particularly type I diabetes), and B-cell malignancies (claimed). They are also useful contents of the substances (claimed) and second contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-ABL30511),
                                                                                                                                                                        (ABB57737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging, diagnostic, genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAR95459-R95509 are antigen binding peptides ("abtides") derived from the monoclonal antibody SM-3 which recogniese a specific polymorphic epithelial mucin tumour antigen found on human breast cancer cells. The abtides are identified from random peptide libraries using specific ligand binding. Abtides mimic the binding specificity of smaller size allowing their production at a lower cost and reducing the extent of their immunogenicity aiding in vivo delivery. The abtides are useful for the diagnosis, detection, imaging and treatment of disease, e.g. tumours, prostate cancer and breast
                                                                                                                                                                                                                                                                                                                New isolated peptide(s) with specific binding activities - obtd. by screening random peptide libraries, for use in diagnostic and therapeutic compsns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                90.9%; Score 30; DB 17; Length 43; 80.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polypeptide (II) sequences. (I) be useful as hybridisation probes, polypeptide (II) sequences. (I) brimers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymocleotides are also used in disgnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to tread disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Condet amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Abtide; prostate specific mucin antigen; human prostate cancer; INCaP; diagnostic; detection; imaging; tumour; phage; peptide library; breast; polymorphic; epithelial.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forenaics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                     AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX31990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae mucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel isolated human secreted proteins and their encoding nucleic acid sequences. The products of the invention are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the presence or amount of expression of the new polypeptides in a sample or by determining the presence or absence of mutations in the new polynucleotides. Specific uses are described for each of the 70 polynucleotides. Specific uses are the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, leukemias, diseases of the immune system, autoimmune (alsorders, leukemias, disease, lymphomas, inflammation, allergies, asthma, sepsis, diabetes, Alzhaimer's and cognitive disorders, schizophrenia, osteoporosis, arthritis, psoriasis, digestive/endocrine disorders, infections and ALDS. The human secreted proteins of the invention are represented in AAX37369-X37441.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ó

Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders

Claim 1; SEQ ID No 892; 880pp; English

and The invention relates to novel isolated polypeptides (I),

```
polynucleotides (II). (I) (II) and the antibody to (I) are useful for diagnosing, preventing and treating diseases including immune system disorders (e.g. congenital and acquired immunodeficiencies, autoimmune tisorders (e.g. congenital and acquired immunodeficiencies, autoimmune transplant rejections and graft versus host disease, infectious diseases (e.g. hepatitis C), bleeding disorders, haemoglobin abnormalities and cher blood-related disorders (sickle cell anaemia), myeloproliferative disorders, primary haemotopoietic disorders, hyperproliferative disorders, primary haemotopoietic disorders, hyperproliferative disorders (e.g. danaemia), myeloproliferative disorders (e.g. danaemia), myeloproliferative disorders (e.g. danaemia), respiratory disorders, dermacological disorders (e.g. arnythmia), respiratory disorders, dermacological disorders, in wound healing, epithelial cell proliferation, endocrine disorders, in wound healing, epithelial cell proliferation, endocrine disorders, can disorder (inflammatory disorders), liver disorders (erg. T-cells, to induce higher affinity antibodies, and as means to induce tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (AlbS). AAU1705-AAU17083 represent novel signal transduction control setting amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Murison JG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammmatory disease, cancer and
dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to transit inflamation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences ANT5942-Y76121 represent polypeptides encoded by the NATS942-Y76121 represent polypeptides encoded by the NATS942-Y7613 represent polypeptides encoded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Murison JG;
                                                                                                                                                                                          by CDNA sequences derived from several mouse, rat or human skin cell types. Sequences AAY75942-Y75947, AAY76020-Y76021, AAY76094-Y76104 and AAY76119 are proteins with an N-terminal signal sequence, indicating that they are secreted. Sequences AAY75986-Y75989, AAY76061-Y76071, AAY76106-Y76109 and AAY761122 are proteins with one or more putative transmembrane domains.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention provides the protein and coding sequences of CDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammarcory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Kumble KD;

The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Kumble KD;

ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
                                                                                                                     Novel isolated nucleic acid encoding a Staphylococcus epidermidis
polypeptide, useful for diagnosing and treating bacterial infections
                                                                                                                                                                                                   Disclosure; SEQ ID 4114; 267pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein and coding sequences of CDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation and cell-cell interaction, in maintaining tissue integrity, in wound healing and in modulating immune responses. The present sequence is a polypeptide of the invention.
